

# Arduino basics

# Weak #04

## Main objectives:

- Introduction to Internal EEPROM
- Multi-tasking LCD
- Interface with IR Remote control

## Study material:

- [Arduino course](#) -> 22
- [Arduino course](#) -> 29 & 30

## 1<sup>st</sup>\_Task:

(From week #03 1<sup>st</sup>\_task)

Develop your code to control the motor movement with an IR remote control

## 2<sup>nd</sup>\_Task:

Attach an RGB LED to an Arduino board and control this LED with an IR remote control, you have to declare a button to turn on & off each LED, also have to declare two buttons to control each LED lightness, after that, you have to attach an LCD displaying the following:

- 1- The color of the LED being controlled right now
- 2- Its state (on - off)
- 3- Its lightness
- 4- Page number EG. 1/3 or 2/3

BONUS: develop your code to make the Arduino keep the last value of each variable even the power is off or the Arduino has been restarted.

Hint: search for EEPROM
